15. SUPPLEMENTARY NOTES This report is published to make available a unique set of atmospheric data for research use by the scientific community. The project was conducted under the operational direction of Mr. Robert Turner, Space Sciences Laboratory, MSFC, for the Office of Applications, NASA Headquarters.					
16. ABSTRACT  This report describes the basic rawinsonde data at each pressure contact from the surface to sounding termination for the 41 stations participating in the AVE III measurement program that began at 0000 GMT on February 6 and ended at 1200 GMT on February 7, 1975. Soundings were taken at 3-hour intervals during a large period of the experiment from most stations within the United States east of about 105 degrees west longitude. Methods of data processing, changes in reduction scheme since the AVE II Pilot Experiment, and data accuracy are briefly discussed. An example of contact data is presented, and microfiche cards of all the contact data are included as an appendix to this report. The AVE III project was conducted as part of NASA's program to better understand and establish the extent of applications for meteorological satellite sensor data through correlative ground truth experiments and to provide basic experimental data for use in studies of atmospheric scales-of-motion interrelationships.  *Texas A&M University

## ACKNOWLEDGMENTS

Many people contributed directly or indirectly to the preparation of this report. The list is too long to acknowledge everyone. No less than approximately 20 people made substantial contributions in data processing, computer programming, analysis of data, and preparation proper of the report. Although names are not given, the authors are grateful to every person who worked diligently behind the scenes to accomplish an important and difficult task in record time.

# **PRESSURE CONTACT SOUNDING DATA FOR NASA'S ATMOSPHERIC VARIABILITY EXPERIMENT (AVE III)**

## **I. INTRODUCTION**

Each Atmospheric Variability Experiment (AVE) has utilized a large network of standard rawinsonde stations acquiring data at 3-hour intervals instead of the routine 12-hour intervals. The measurement period was chosen in each case when meteorological conditions were predicted to contain the particular mesoscale systems of interest for studies. Satellite and radar data have also been obtained to supplement the rawinsonde data of AVE II and III. The long-term objective of the AVE program is to understand the structure and dynamics of mesoscale systems. The purpose of this report is to present the rawinsonde data from AVE III.

## **II. OTHER AVE MEASUREMENT PERIODS**

The first NASA Atmospheric Variability Experiment (AVE I) was conducted from February 19 to February 22, 1964. Scoggins and Smith [1,2] have presented data from the AVE I experiment, and a compilation of studies from AVE I has been presented by Scoggins et al. [3]. Results from this experiment demonstrated conclusively that systems with a time scale of less than 12 hours are present and lead to large temporal and spatial variations in the observed structure of the atmosphere and in weather. AVE I demonstrated the need for additional experiments of this type to better understand physical processes in the atmosphere and their influence upon changes in local weather conditions.

The second Atmospheric Variability Experiment (AVE II) [4] was conducted from 12 GMT May 11 to 12 GMT May 12, 1974. During this time rawinsonde soundings were taken at 3-hour intervals from 54 stations over the eastern United States. The data have been presented by Scoggins and Turner [5] and Fuelberg and Turner [6]. Investigations utilizing these data are described by Fuelberg and Scoggins [7] and Overall and Scoggins [8]. Some conclusions from these studies relative to the value of more frequent rawinsonde measurements are: (1) these 3-hour observations permit a more accurate evaluation of storm (cloud) motion in relation to the ambient field than is possible with routine 12-hour data, and (2) significant changes in vertical motion associated with mesoscale systems can be identified over 3-hour intervals but often not in routine intervals.

The AVE IV measurement phase was concluded on April 24 and 25, 1975. A similar program, the Atmospheric Variability Severe Storm Experiment (AVSSE) [9], was run in conjunction with Goddard Space Flight Center aircraft observations on April 27 and 28 and May 6 and 7, 1975. The data for these programs are being processed and will be documented in later reports.

### III. THE AVE III MEASUREMENT PROGRAM

The AVE III was completed during the period from 00 GMT February 6 to 12 GMT February 7, 1975. The 41 rawinsonde stations that participated in the acquisition of sounding data at 3-hour intervals over the United States east of approximately 105 degrees west longitude are listed in Table 1. Soundings were taken at 9 time periods: February 6 at 0000 GMT, 0600 GMT, 1200 GMT, 1500 GMT, 1800 GMT, and 2100 GMT and on February 7 at 0000 GMT, 0600 GMT, and 1200 GMT. The stations included in the experiment are shown in Figure 1. The surface synoptic weather maps depicting conditions on February 6 and 7 are presented in Figure 2. A tabulated example of the 3-hour data from the Marshall Space Flight Center, Alabama, rawinsonde station is presented in Table 2 to indicate the format of the data available from the other 40 stations within the AVE III network. A complete microfiche copy of the contact data for all stations is enclosed as an appendix in the pocket attached to the inside of the back cover of this report. Data from other sources such as satellite, radar, and surface stations are also available and will be presented as appropriate in subsequent reports prepared from analyses of these data.

The objectives of AVE III were to (1) capture the development and evolution of mesoscale systems during winter conditions, (2) measure the temporal and spatial variability of atmospheric parameters/systems of a scale smaller than that normally detected from data measured at intervals of 12 hours, and (3) utilize satellite data to a maximum in furthering the application to mesoscale weather predictions. The period was chosen for the AVE III measurements to correspond to the occurrences of a strong cold front, large horizontal temperature gradients, both cloudy and cloud-free regions, and visible snow cover. The conditions were successfully met even though a 48-hour weather prediction was necessary to allow time to activate the rawinsonde network.

### IV. DISCUSSION OF BASIC DATA

#### A. Collection

Original records necessary for reducing the soundings were sent to the Aerospace Environment Division, Space Sciences Laboratory, NASA-Marshall Space Flight Center, Alabama, for further processing. Personnel at the Marshall Space Flight Center computed baseline data and extracted angle data at 30-second intervals, or 1-minute intervals in a few cases, from strip charts and punched these into computer cards that were sent to Texas A&M University. Personnel at Texas A&M University extracted ordinate data at each pressure contact and punched these into cards. Soundings were computed at Texas A&M using an IBM 360/65 computer.

## B. Methods of Processing

The procedure used to compute soundings is similar to that used on the AVE IIP data and is described by Fuelberg [10]. Since approximately 120 000 data cards, each containing about five variables, were punched for AVE III, careful editing procedures were necessary to ensure accurate soundings. Keypunched data were checked for errors by calculating centered differences on the input data; and processed soundings, based on the input data, were further checked by calculating centered differences of wind direction and speed and by calculating the lapse rates of temperature and dew point. All questionable data were checked against the original strip chart records, and erroneous data were corrected. Errors that were discovered after these checks were made and the data corrected are listed in Table 3.

The final data sets of the AVE III experiment consist of data computed at each pressure contact and at 25-mb intervals. Thermodynamic quantities were computed at each pressure contact, while wind data were computed at 30-second intervals by means of centered finite differences over a 1-minute period and then smoothed and interpolated to each pressure contact. The detailed profiles were then interpolated to give data at 25-mb intervals as reported by Fuelberg and Turner [11]. The contact data are the subject of this report.

## C. Changes in the Reduction Procedure

Several changes in the reduction procedure used for the AVE IIP data have been made that affect the output soundings of the AVE III experiment; these will be described here. Two important changes were made in the program used to compute contact data. Humidity values, including dew point temperature, are now computed only at temperatures above  $-40^{\circ}\text{C}$ ; at temperatures below  $-40^{\circ}\text{C}$ , humidity values are indicated by fields of nines, as are missing values of humidity. In the AVE IIP data, nines were used to indicate both missing humidity values and moisture values based on relative humidity less than 5 percent. The AVE III data contain computed moisture values down to a relative humidity of 1 percent; if the value of relative humidity is below 1 percent, it is set equal to 1 percent from which the other moisture variables are computed. The second change involves the indication of winds that are based on low elevation angles. An asterisk following wind speed in the AVE III data means that the elevation angle was between 10 degrees and 6 degrees. A double asterisk indicates that the elevation angle was less than 6 degrees. Since winds computed at low elevation angles have large rms errors, these data should be used with caution. These two changes are also carried over to the 25-mb data.

An important change was made in the program that produced 25-mb data from contact data. In the AVE IIP data set, 25-mb values of wind direction, scalar speed, and the u- and v-wind components were interpolated independently of each other. The AVE III scheme interpolates the 25-mb values of u- and v-wind components and then determines wind direction and wind speed from the components.

Wind data at Ft. Totten, New York, and Wallops Island, Virginia, could not be computed because angle data were not available. Values of wind direction and speed as a function of time from release have been computed by the National Weather Service using a scheme different from that used in AVE III. These wind data are not contact data but are presented with the attached microfiche set of contact data as a supplement to the appendix.

## V. DISCUSSION OF SOUNDING DATA

### A. Accuracy Estimates

Estimates of the rms errors in the thermodynamic quantities of the AVE III data are the same as those given by Scoggins and Smith [1] for the AVE I data and Fuelberg [10] for the AVE IIP data. These estimates are:

Parameter	Approximate rms Error
Temperature	1°C
Pressure	1.3 mb from surface to 400 mb; 1.1 mb between 400 and 100 mb; 0.7 mb between 100 and 10 mb.
Humidity	10 percent
Pressure Altitude	10 gpm at 500 mb; 20 gpm at 300 mb; 50 gpm at 50 mb.

The rms errors for wind speed and direction are difficult to describe since they are a function of tracking geometry and other factors. The rms errors in the AVE III wind data are the same as those given by Fuelberg [10] for the AVE IIP data. Maximum rms errors for winds computed at 30-second intervals (based on the worst geometric tracking configuration) are: at 700 mb, about 2.5 mps at an elevation angle of 10 degrees and about 0.5 mps at an elevation angle of 40 degrees; at 500 mb, 4.5 mps and 0.8 mps for the same elevation angles; and at 300 mb, 7.8 mps and 1.0 mps, respectively. After assuming typical values of scalar wind speed at the various levels, maximum rms errors in wind direction were determined. The maximum rms errors at 700 mb range from about 9.5 degrees at an elevation angle of 10 degrees to about 1.3 degrees at an elevation angle of 40 degrees. At 500 mb, the errors are 13.4 degrees and 1.8 degrees at the same elevation angles, while at 300 mb, the maximum errors are 18.0 degrees and 2.5 degrees, respectively. The accuracy of the wind data on pressure contacts and at 25-mb intervals is

greater than that stated for the 30-second winds because of the added smoothing and interpolation performed. In addition, errors cited for the 30-second winds were maximum for the stated conditions.

## **B. Tabulated Data**

An example of AVE III contact data is given in Table 2. An explanation of the column headings is given in Table 4, and a list of missing soundings is given in Table 5. In the example, the first line of data for the time of 0 minutes is surface data. A series of nines is used to indicate missing data. The three numbers in the upper right corner of each page are the number of pressure contacts computed, the minimum pressure obtained (mb), and an angle identifier with the value 0 for 30-second angle input and 1 for 1-minute angle input.

Questions relative to these data can be directed to the George C. Marshall Space Flight Center, Aerospace Environment Division, Space Sciences Laboratory, Marshall Space Flight Center, Alabama 35812.

TABLE 3. COMMENTS AND KNOWN ERRORS REMAINING  
IN THE REDUCED DATA OF THE AVE III PROJECT

Station	Date/GMT	Error
402 Wallops Island, Virginia	All time periods	Angle data were not available for Stations 402 and 486 to compute winds using the AVE procedure. Winds computed by the National Weather Service are given in the appendix.
486 Ft. Totten, New York	All time periods	
226 Centerville, Alabama	6/1800	The surface pressure should be 999.3 mb. Pressure altitude may be corrected by adding 49 m to each value given.

TABLE 4. EXPLANATION OF COLUMN HEADINGS OF  
TABULATED SOUNDING DATA FOR THE  
AVE III PROJECT

TIME (MIN)	Time after balloon release.
CNTCT	Contact number.
HEIGHT (GPM)	Height of corresponding pressure surface in geopotential meters.
PRES (MB)	Pressure in millibars.
TEMP (DG C)	Ambient temperature in degrees Celsius. Note: An asterisk indicates that time from release and/or temperature were linearly interpolated.
DEW PT (DG C)	Dew point temperature in degrees Celsius.
DIR (DG)	Wind direction measured clockwise from true north and is the direction from which the wind is blowing.

TABLE 4. (Concluded)

SPEED (M/SEC)	Scalar wind speed in meters per second. Note: An asterisk indicates that wind quantities are based on an elevation angle that is between 10 degrees and 6 degrees. A double asterisk indicates that the elevation angle is less than 6 degrees.
U COMP (M/SEC)	The E-W wind component, positive toward the east and negative toward the west.
V COMP (M/SEC)	The N-S wind component, positive toward the north and negative toward the south.
POT T (DG K)	Potential temperature in degrees Kelvin.
E POT T (DG K)	Equivalent potential temperature in degrees Kelvin.
MX RTO (GM/KG)	Mixing ratio in grams per kilogram.
RH (PCT)	Relative humidity in percent.
RANGE (KM)	Distance balloon is from release point along a radius vector.
AZ (DG)	Direction toward balloon measured clockwise from true north.

TABLE 5. LIST OF MISSING SOUNDINGS IN THE AVE III PROJECT

Station	Date/Time	Reason for Omission
226, Centerville	06/0600	Sounding not taken.
451, Dodge City	07/0000	Sonde severely jarred at release.
